

PRODUCED WATER MANAGEMENT

It's all about reuse and meeting environmental discharge standards

Offshore and onshore regulations are increasingly stringent requiring additional treatment before discharge, and in some cases in an offshore environment, zero discharge.

Produced water treatment requirements vary by location and unpredictable changes in produced water quality makes produced water challenging to manage.

THE WATER STANDARD SOLUTION SUPPORTS:

- Treating produced water for EOR reinjection, providing a sustainable and environmentally preferred closed-loop solution
- Meeting reinjection specifications or regulatory requirements for discharge
- Systems to treat emulsions from CEOR injection using innovative, proven technology
- Minimizing the footprint impact and storage requirements
- Proven treatment methods while developing customized solutions dictated by the reservoir
- Flexibility in managing the produced water life cycle
